IN THE CLAIMS:

Claim 1 has been amended as follows:

- 1. (Currently Amended) A medical system architecture for interactive transmission and progressive representation of compressed image data of multi-component images, comprising:
 - at least one imaging modality for acquiring that acquires image data representing examination images;
 - for each imaging modality, a computer workstation associated therewith for processing that processes the image data acquired by the associated imaging modality;
 - a communication network in communication with said computer workstation for processing that transfers said examination images, after processing in the computer workstation, to locations remote from said computer workstation;
 - a storage device in communication with said communication network for storing that stores said examination images;
 - at least one further workstation in communication with said communication network for post-processing that post-processes the examination images processed in said computer workstation;
 - a compression device in communication with said computer network fer compressing that compresses and organizing organizes the image data representing said examination images and for storing stores the compressed data in packets, as packetized image data, with parameters linked to the respective packets defining permissible access to the respective packets; and

a decompression device in communication with said communication network

for decompressing that decompresses the packetized image data

packet-by-packet dependent on a request from said further

workstation, for causing to cause multi-component images to be

generated at said further workstation with progressive parameters.

Claim 2 has been amended as follows:

2. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said compression device generates parameters, as said parameters respectively linked with said packets, selected from the group consisting of a parameter specifying an image resolution level, a parameter specifying an image quality level, a parameter specifying a region of interest, a parameter specifying a slice thickness, and a [[a]] parameter specifying a component index, and wherein said decompression device employs said parameters to generate said multicomponent images with at least one of a progressive image resolution, progressive image quality levels, consistent region of interest presentation, and variable slice thickness, respectively.

Claim 3 has been amended as follows:

3. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said decompression compression device generates supplementary information and requests and transmits said supplementary information and requests to said further workstation together with the decompression compression packetized image data.

Claim 4 has been amended as follows:

4. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said decompression compression device transmits a total quantity of data in compressed state, with said parameters, to said further workstation.

Claim 5 has been amended as follows:

5. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said decompression compression device transmits an entire file for an image in compressed state to said further workstation.

Claim 6 has been amended as follows:

6. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said decompression compression device transmits information identifying packets that have already been sent and parameters that have already been transmitted in advance to said further workstation.

Claim 7 has been amended as follows:

7. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said decompression compression device generates and communicates a message to said further workstation after conclusion of transferring a consistent set of said image data.

Claim 8 has been amended as follows:

8. (Currently Amended) A medical system architecture as claimed in claim 7 wherein said decompression compression device generates and transmits a render request as said message.

Claim 9 has been amended as follows:

9. (Currently Amended) A medical system architecture as claimed in claim 7 wherein said decompression compression device generates and transmits a storage recommendation as said message.

Claim 10 has been amended as follows:

- 10. (Currently Amended) A medical system architecture as claimed in claim 1 wherein said further workstation has user rights associated therewith, and wherein said decompression compression device transmits the decompression compression packetized image data, or portions thereof, to said further workstation dependent on said user rights.
- 11. (Original) A method for operating a medical system architecture having at least one imaging modality for acquiring image data representing examination images, a computer workstation associated with each imaging modality for processing the image data acquired by that imaging modality, a communication network in communication with said computer workstation for transferring said examination images to a location remote from said computer workstation, a device for storing said examination images in communication with said communication network, and a further workstation in communication with said communication network for post-processing the examination images processed by the computer workstation, said method comprising the steps of:

generating raw data of medical multi-component images using said imaging modality, as said image data;

compressing said raw data to generate compressed image data;

organizing and storing said compressed image data in packets and linking respective parameters to the packets designating accessibility to the respective packets;

transferring the compressed image data to a decompression location; and

at said decompression location, decompressing the compressed image data to form multi-component images with progressive reproduction dependent on said parameters.

Claim 12 has been amended as follows:

12. (Currently Amended) A method as claimed in claim [[10]] 11 comprising entering requests into said further workstation about specific parameters associated with said image data in said packets.

Claim 13 has been amended as follows:

13. (Currently Amended) A method as claimed in claim [[10]] 11 wherein said further workstation has user rights associated therewith, and comprising analyzing said parameters to determine whether said decompressed image data can be presented at said further workstation dependent on said user rights.

Claim 14 has been amended as follows:

14. (Currently Amended) A method as claimed in claim [[10]] 11 comprising additionally transmitting supplementary information and requests from said decompression location to said further workstation.

Claim 15 has been amended as follows:

15. (Currently Amended) A method as claimed in claim [[10]] 11 comprising selecting said parameters from the group consisting of a parameter defining progressive image resolution, a parameter defining progressive image quality levels, a parameter identifying region of interest consistency, and a parameter designating a variable slice thickness.
